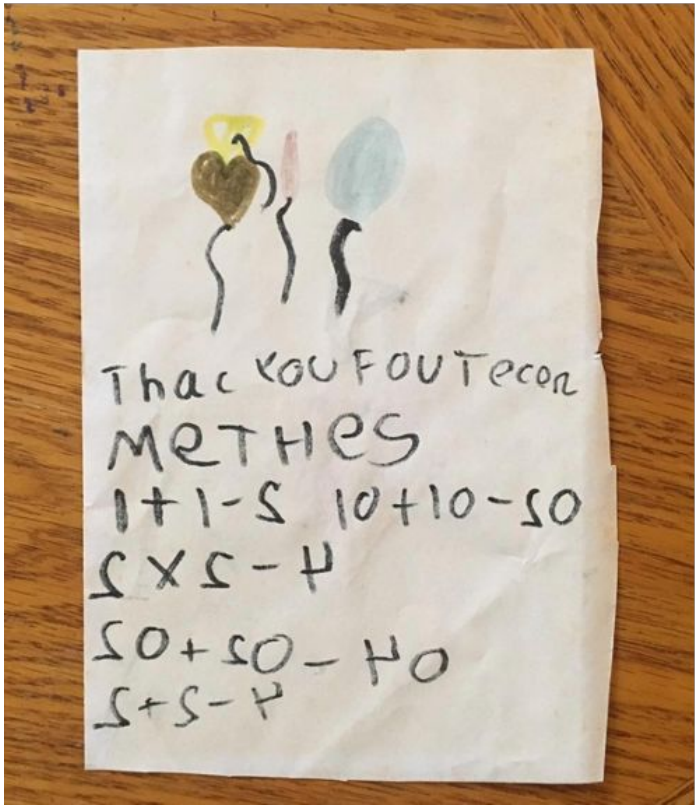
Data Science Basics in R

Day 1: Introduction to Statistical Programming

Introductions

- Your name
- What you do for school, work, and/or fun
- Why you signed up for this course
- Have you ever used R before?

Introductions



Housekeeping notes

- Take a break whenever you need one, we will also have a few structured breaks as a larger group
- Outlet locations
- Trash cans
- Try to come with a charged laptop
- If you have questions, you can find me at *sde31@georgetown.edu*

Housekeeping notes

All course materials are available on github, and we'll talk more about github in general later in this course.

https://github.com/seaneff/data-science-basics-2024

What to expect: Learning R

- Learning R is fun! And also frustrating.
- You won’t be an expert by the end of this week.
- But over time and as you practice, it gets easier!

What to expect: The next week

- We'll balance slides/demos with hands-on exercises.
- You decide how you learn best...
  - listening with your computer away
  - laptop out and typing along
  - taking notes with paper/pen
- All of these materials are publicly accessible on github.

Workshop goals

This workshop will build literacy and basic proficiency in statistical programming, with a focus on the skills needed to conduct data analyses in professional healthcare and public health workplaces.

We will cover the basics of data management, data cleaning, data visualization, and basic statistical calculations in R, and version control in github. Participants will leave with a small portfolio of relevant data visualizations and analyses completed using a real-world public health dataset.

Workshop goals

- Learning to program (in R) can be fun and creative, and doesn't have to be overwhelming or intimidating.
- Anyone can learn to write code.

Artwork by Allison Horst

Learning by doing

For some people, it's easier to learn by doing, typing, and making mistakes. Others prefer to listen, think, and work through problems later on their own.

In this workshop, we'll pause to do worked examples. Sometimes these will be confusing. This is the point! We will learn together by trial and error.

If you are more comfortable following along for now, feel free to just watch and try at home. But I really encourage you to try, the best way to learn R is to repeatedly do stuff wrong and then figure out the errors.

Artwork by Allison Horst

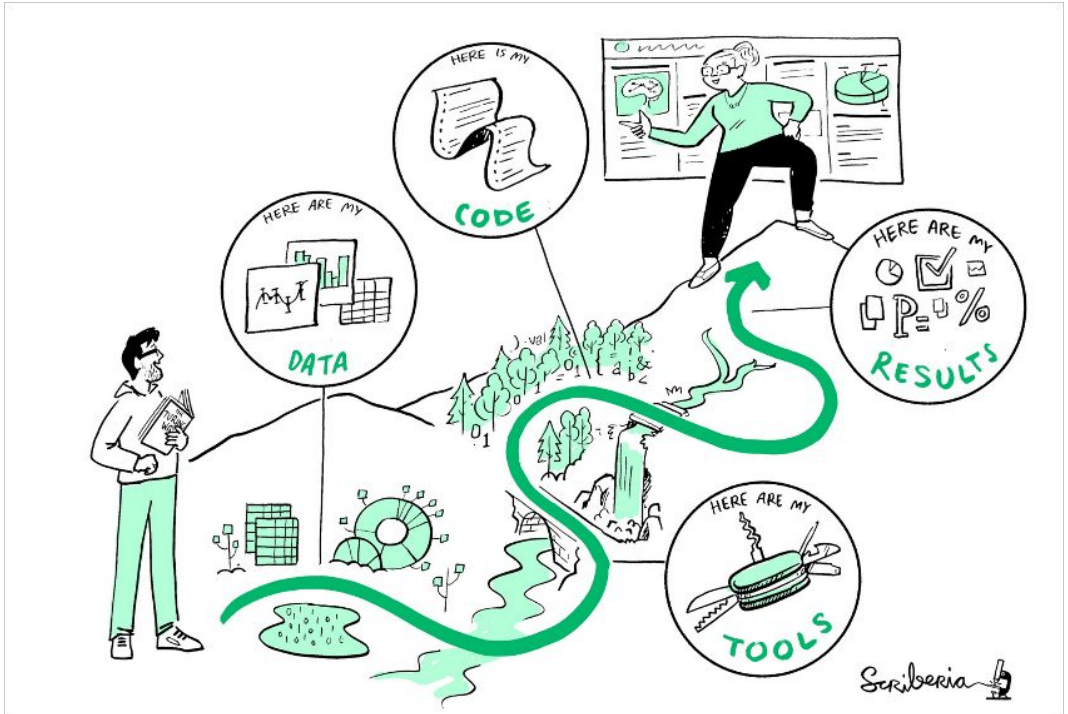
Goals for today

- Understand what statistical programming is
- Get acquainted with Rstudio
- Write your very first R code (at least, of this workshop)
  - vectors
  - functions
  - accessing documentation
- Explore github to access course materials

What is statistical programming, and why should I care?

What is statistical programming?

Statistical programming is using code to clean, analyze, visualize, and interpret data.



What is R?

- R is a programming language for statistical computing
- Created by Ross Ihaka and Robert Gentleman in 1996
- R is open-source and free
- Many people use R in different ways and for different purposes, but it's defined specifically for data analysis and visualization (unlike other open-source languages like python)

What is RStudio?

- R Studio is, put simply, a place to write and run R code
- It's an IDE (integrated development environment) and supports both R and python
- It's also free (with enterprise upgrades)

Why learn R?

- Learning R helps you understand your data and understand how analysis works, whether you're a researcher, a data scientist, or someone who collaborates with folks who do analysis
- Coding helps you think rigorously about your questions
- It's free (vs. other more expensive tools like SAS or SPSS)
- Shareable, reproducible code and research
- Lots of academics/companies/agencies use it
- It's fun (honestly)

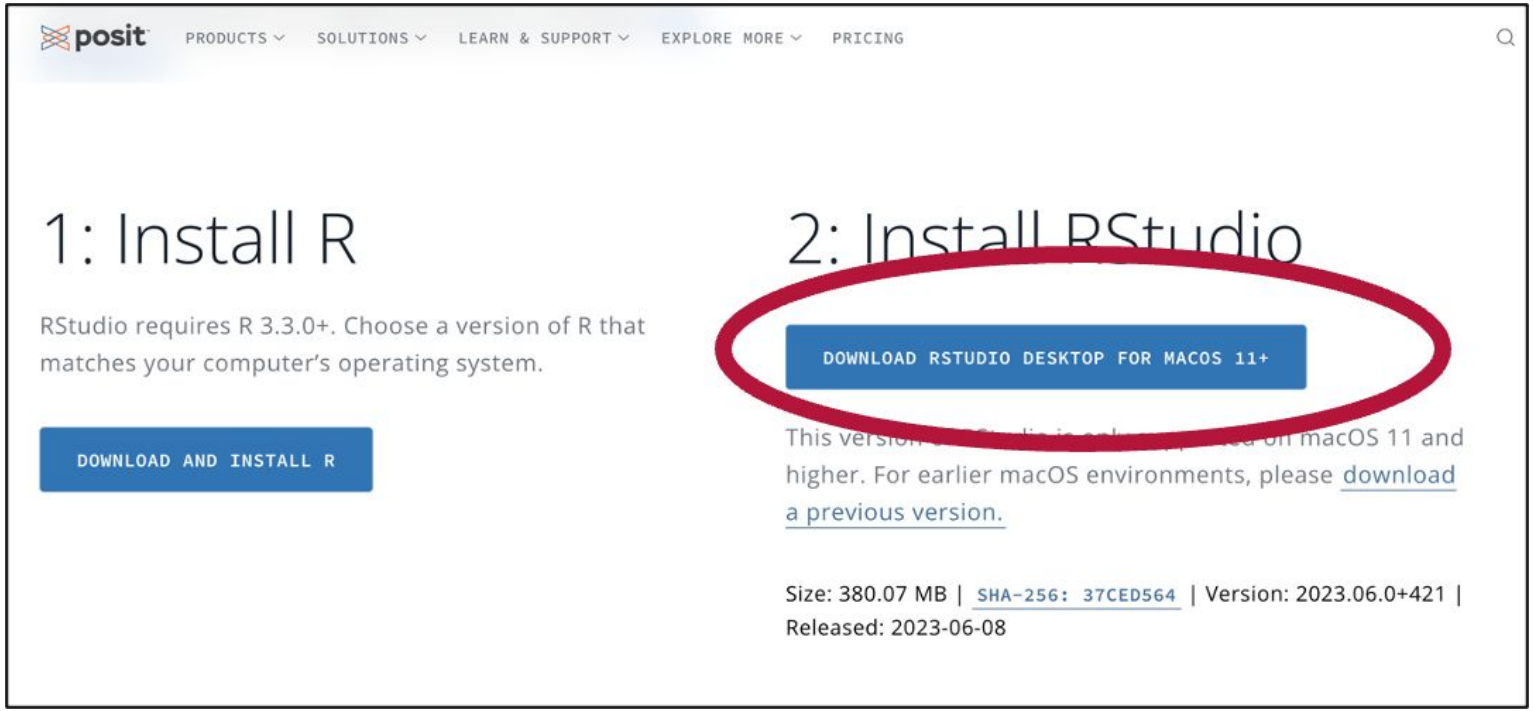
Downloading R and RStudio

Download R:

https://cran.r-project.org/

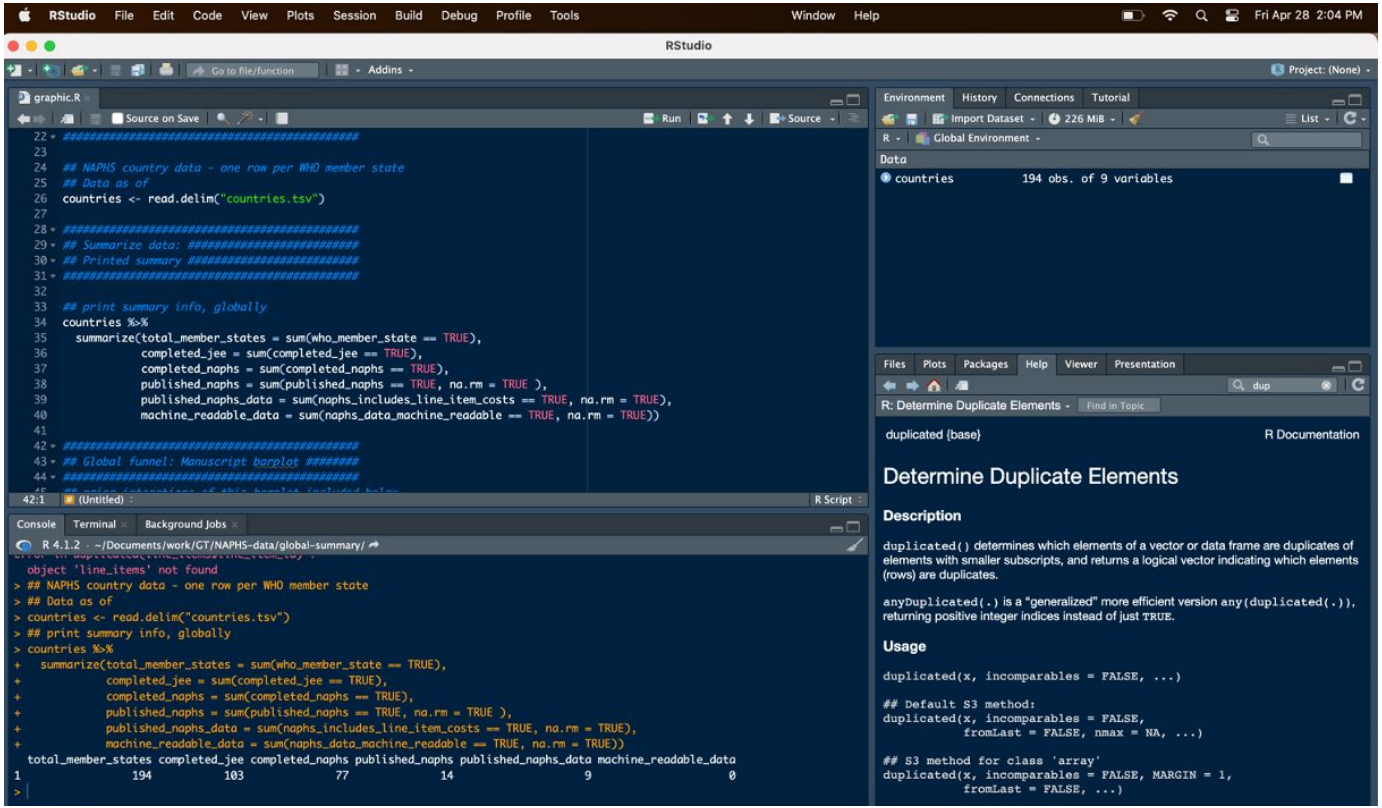
Download RStudio:

https://posit.co/download/rstudio-desktop/#download

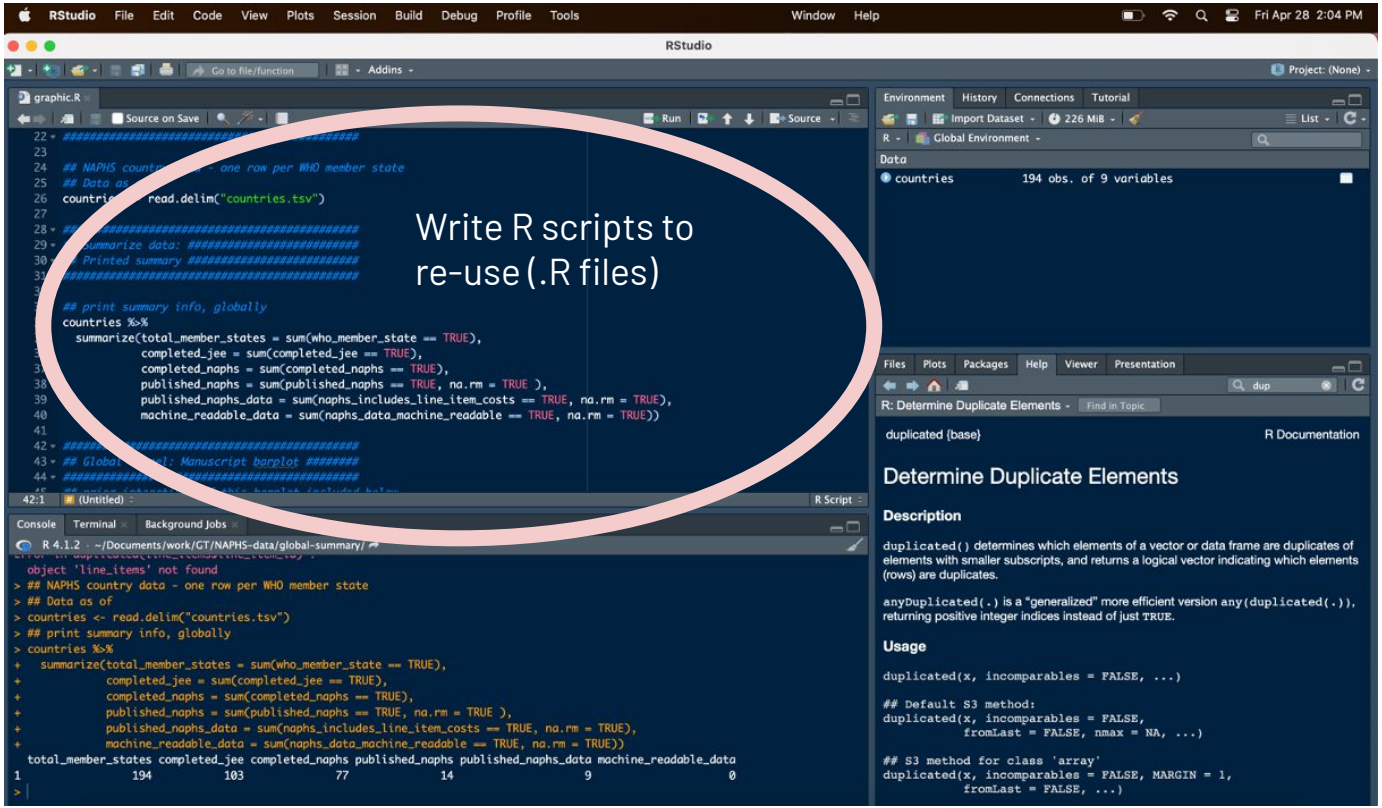


How do I use RStudio?

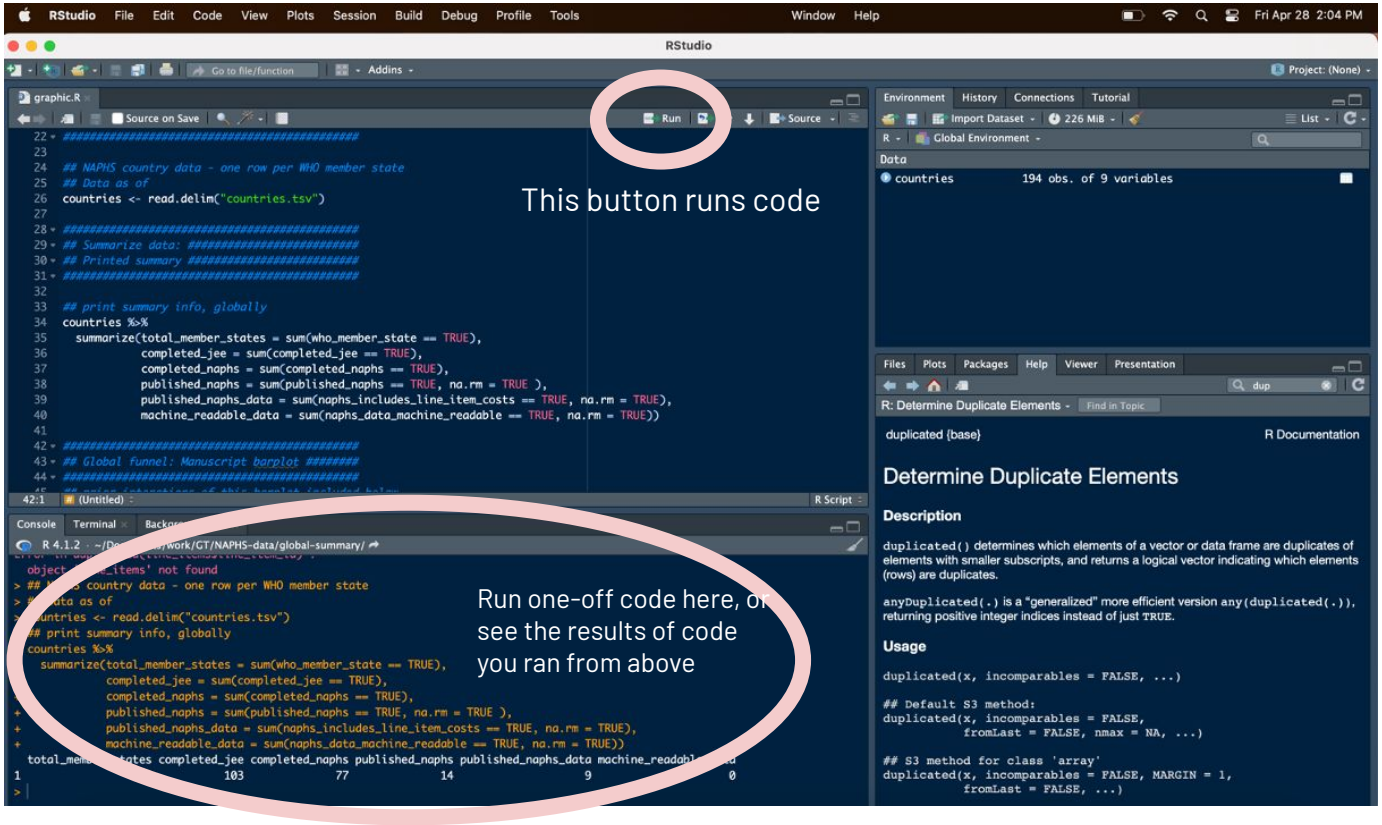
RStudio console



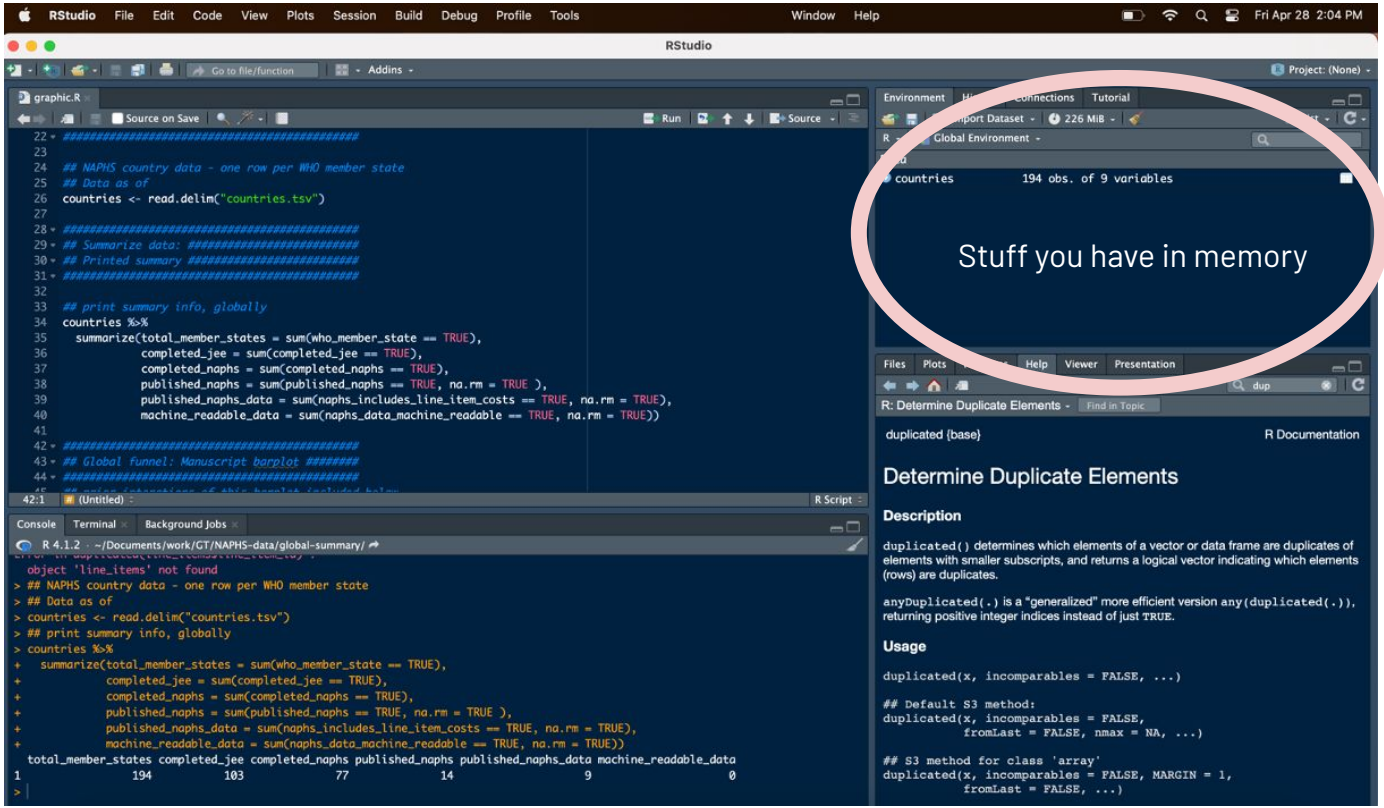
RStudio console



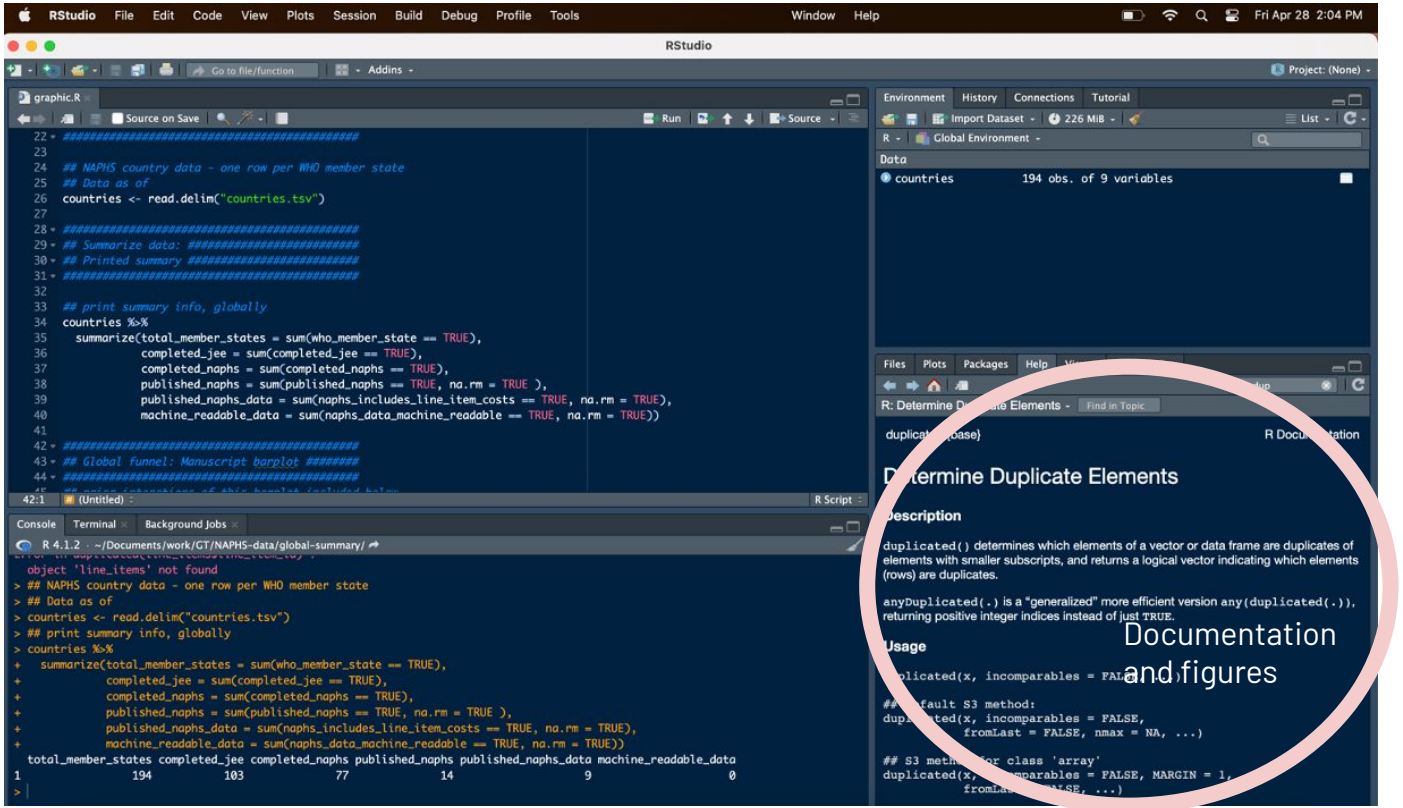
RStudio console



RStudio console



RStudio console



Now you try!

Open RStudio on your computer and click around

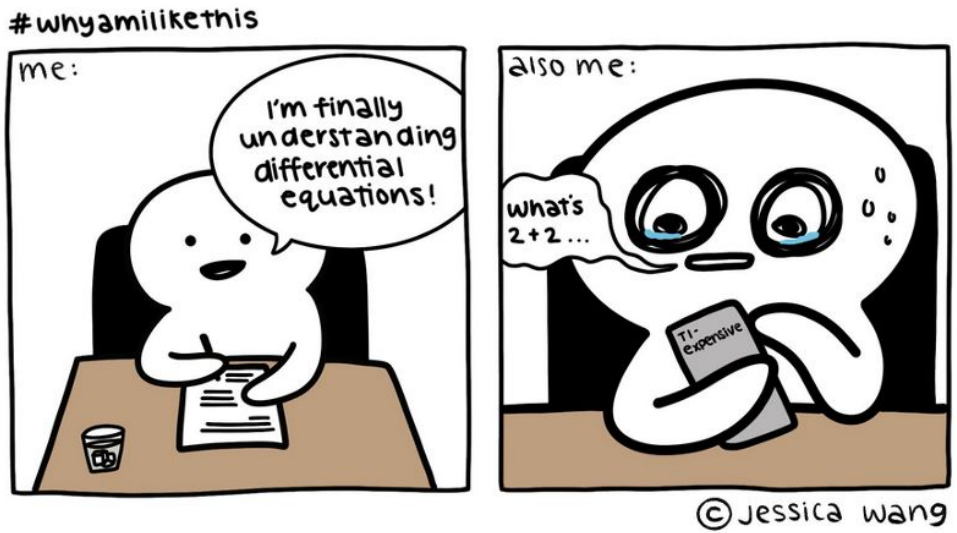
15 minute break
(and a note on worked examples)

- If you haven't already, please try to download R and Rstudio before tomorrow's class. I'll be around by email if you have any questions, and can help troubleshoot.
- Today, we'll do some worked examples sharing my laptop. If you already have R and Rstudio installed on your laptop, feel free to follow along there.

R Basics

R as a calculator

- R can do everything a basic calculator can do
- Using R as a calculator is a great first step



Comic by Jessica Wang. Accessed online: https://i.redd.it/dmayt2tc3e551.jpg

Using R as a calculator

```
1+1
```

```
## [1] 2
```

```
10-8
```

```
## [1] 2
```

```
(6-3)*4
```

```
## [1] 12
```

Using R as a calculator

```
abs(-18)
```

```
## [1] 18
```

```
log(1)
```

```
## [1] 0
```

```
log(1)
```

```
## [1] 0
```

Using R as a calculator

Symbols and syntax

- **Addition** (1+1)
- **Subtraction** (2-1)
- **Multiplication** (3*4)
- **Division** (7.2/9)
- **Exponents** (2^7)
- **Square root** (sqrt(9))
- **Order of operations** (7/(3*2))

Now you try!

- Use R to do some basic math
  - Add two numbers together
  - Multiply three or more numbers
  - Take the square root of a number

Objects

- An object is something you save to R's working memory
- It can be almost anything
  - A string (e.g., your name)
  - A number (e.g., 3.14)
  - A dataset (e.g., that file you have in Excel)
- We assign objects using a little arrow with the syntax (<-)
- When doing data analysis, the most common object you'll probably save is a dataframe, like an Excel or .csv file that you can access from within R (more on this later)

Objects

```
my_first_object <- 3
```

```
my_first_object
```

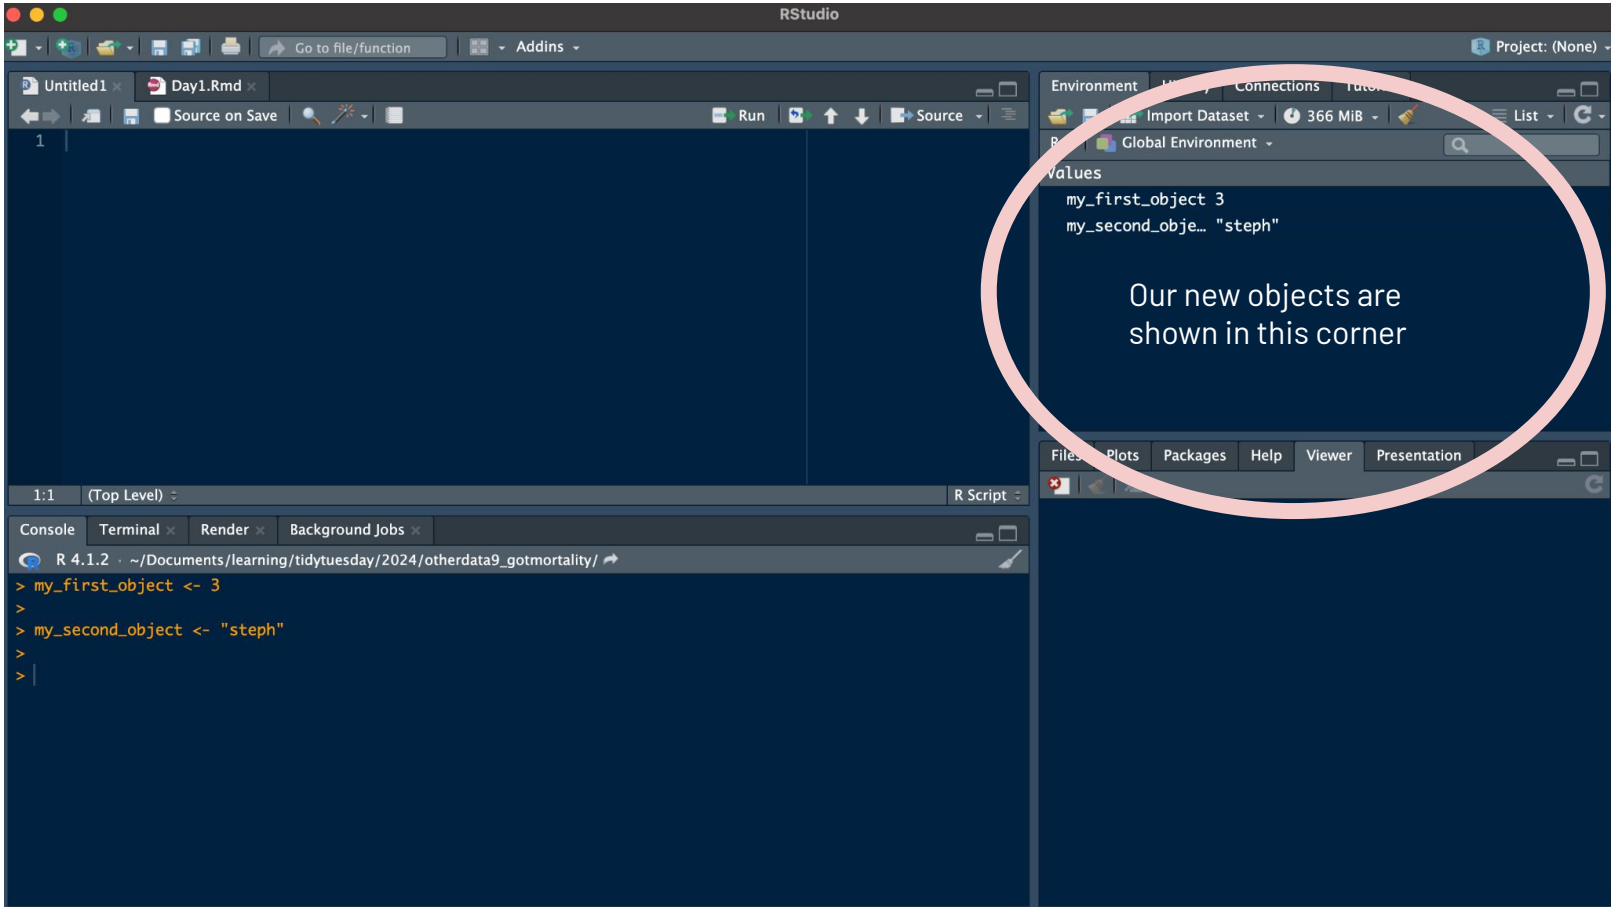
```
## [1] 3
```

```
my_second_object <- "steph"
```

```
my_second_object
```

```
## [1] "steph"
```

Objects



RStudio

Using (numeric) objects to do math

- Just like we did when we used R as a calculator, you can also use numeric objects to do math
- When you do this, the objects themselves don't change unless you explicitly re-assign them to new variables

Using (numeric) objects to do math

```
my_first_object
```

```
## [1] 3
```

```
my_first_object*2
```

```
## [1] 6
```

```
my_first_object * my_first_object
```

```
## [1] 9
```

Now you try!

- Pick your favorite number, and save it as an object
- Pick another number, and save it as another object
- Do one basic calculation (e.g., addition) with your objects
- You may run into issues. That's okay! We'll talk them through.

Source: XKCD

Data types in R

- **numeric:** a number (e.g., -1, 0, 893243.343)
- **logical:** TRUE or FALSE (no quotations)
- **character:** letters and words (tricky: or a number stored as letter!)
- The function is() helps us figure out what type of data we have

```
is(-1)
```

```
## [1] "numeric" "vector"
```

```
is(TRUE)
```

```
## [1] "logical" "vector"
```

```
is("What is this?")
```

```
## [1] "character"          "vector"             "data.frameRowLabels"
## [4] "SuperClassMethod"
```

Numeric data

```
my_favorite_number <-  3
my_favorite_number
```

```
## [1] 3
```

```
my_house_number <-  1416
my_house_number
```

```
## [1] 1416
```

```
example_result <-  3*4
example_result
```

```
## [1] 12
```

Character data

```
policy <-  "International Health Regulations (2005)"
policy
```

```
## [1] "International Health Regulations (2005)"
```

```
organization <-  "UNAIDS"
organization
```

```
## [1] "UNAIDS"
```

Logical data

```
logical_example <-  TRUE
logical_example
```

```
## [1] TRUE
```

```
second_logical_example <-  FALSE
second_logical_example
```

```
## [1] FALSE
```

Check your understanding!

```
is(5)
```

```

```

```
is(FALSE)
```

```

```

```
is("Georgetown")
```

```

```

Check your understanding!

```
is(5)
```

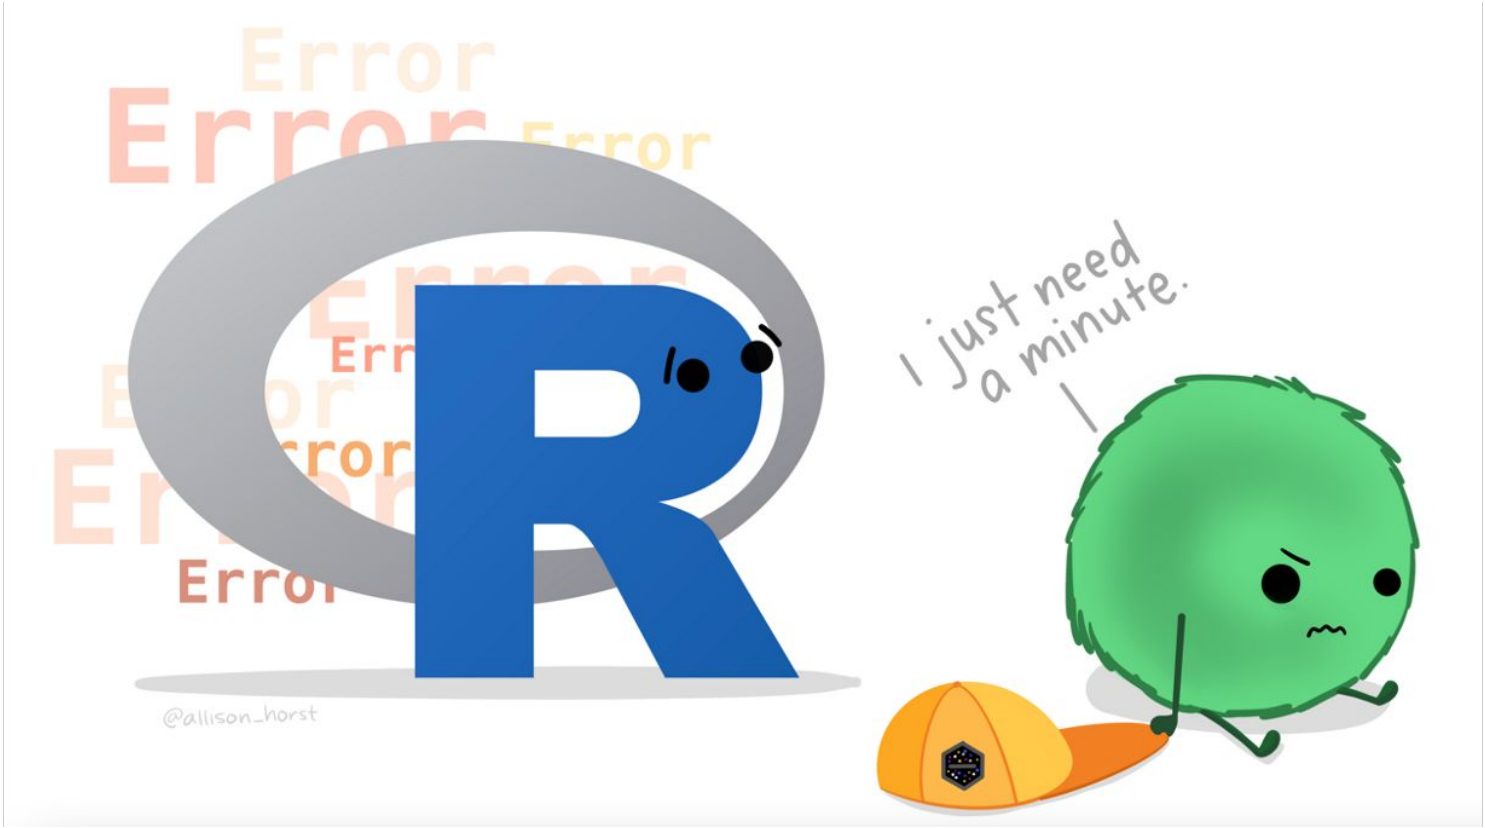
```
## [1] "numeric" "vector"
```

```
is(FALSE)
```

```
## [1] "logical" "vector"
```

```
is("Georgetown")
```

```
## [1] "character"           "vector"              "data.frameRowLabels"
## [4] "SuperClassMethod"
```

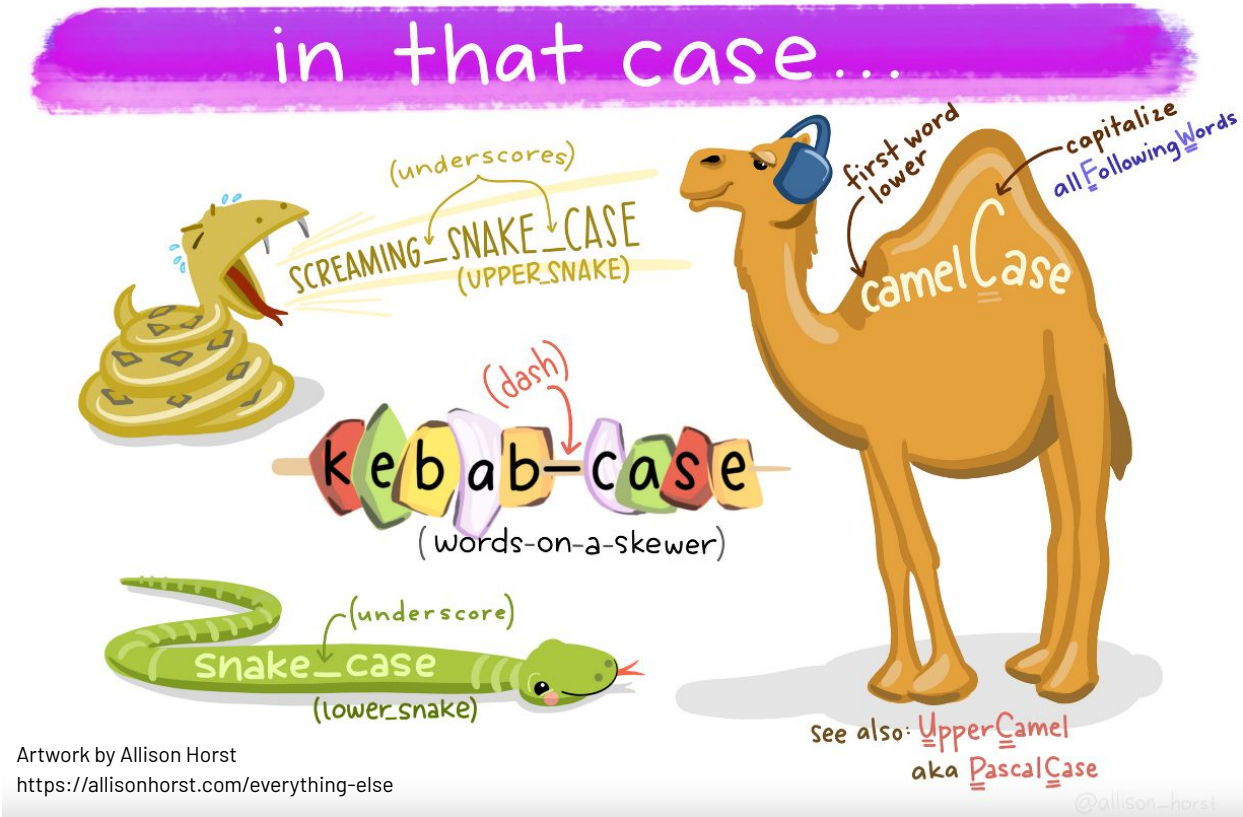


Artwork by Allison Horst
https://allisonhorst.com/everything-else

Rules for naming objects

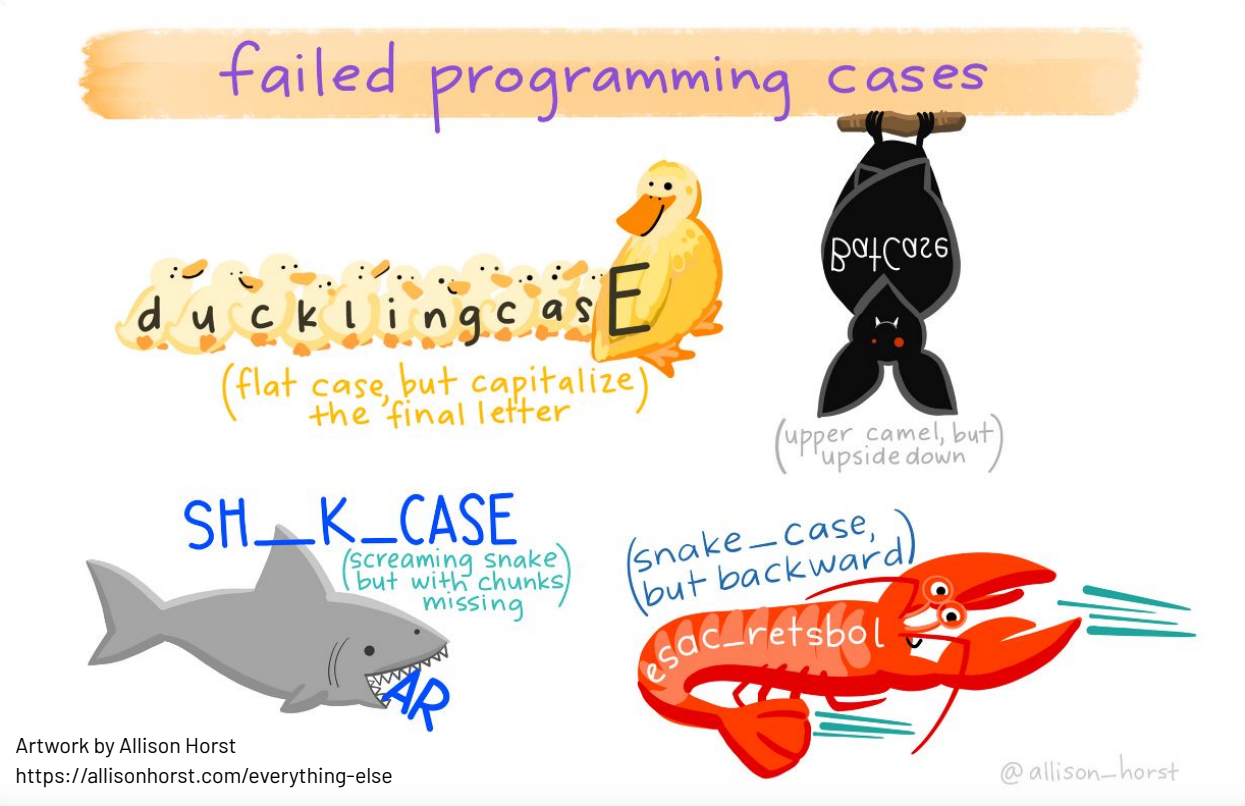
- General naming requirement: a variable name can’t start with a number or a dot (.)
- R is case sensitive (‘A’ is different than ‘a’)
- General rules of thumb: aim for consistency
    - snake_case
    - camelCase
    - whatever.this.is
- Chose a name you’ll understand when you open your code the next day, or when someone else reviews it

Rules for naming objects



Artwork by Allison Horst
https://allisonhorst.com/everything-else

Rules for naming objects



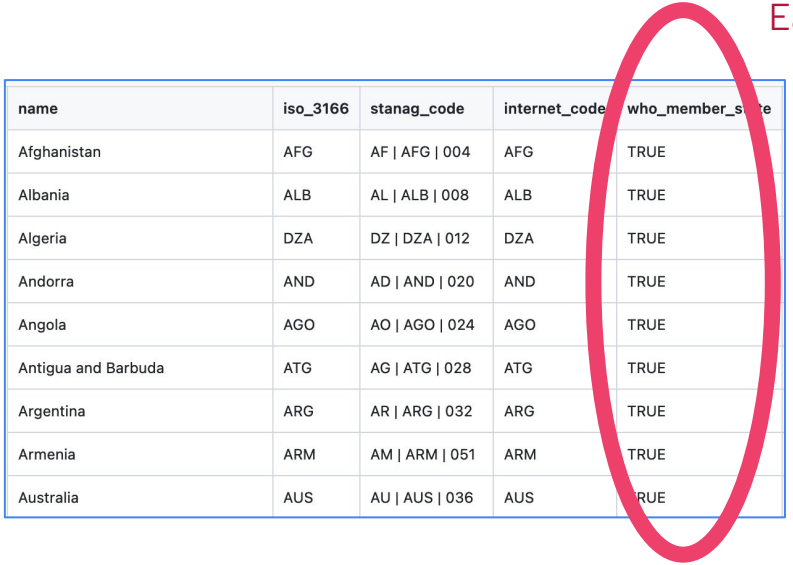
Artwork by Allison Horst
https://allisonhorst.com/everything-else

Now you try!

- Create three new objects, with any allowable names you want. Try to use a consistent naming style.
  - Numeric (we already did this, but practice is good)
  - Character
  - Logical

Vectors

- Vectors are grouped data elements in a specific order
- For example, data in a specific column in Excel



name	iso_3166	stanag_code	internet_code	who_member_s[illegible]e
Afghanistan	AFG	AF | AFG | 004	AFG	TRUE
Albania	ALB	AL | ALB | 008	ALB	TRUE
Algeria	DZA	DZ | DZA | 012	DZA	TRUE
Andorra	AND	AD | AND | 020	AND	TRUE
Angola	AGO	AO | AGO | 024	AGO	TRUE
Antigua and Barbuda	ATG	AG | ATG | 028	ATG	TRUE
Argentina	ARG	AR | ARG | 032	ARG	TRUE
Armenia	ARM	AM | ARM | 051	ARM	TRUE
Australia	AUS	AU | AUS | 036	AUS	TRUE

- When you've thought previously about data analysis, you probably think about vectors, even if you didn't use that name

Vectors

```
c("HIV", "TB", "malaria")
```

```
## [1] "HIV"     "TB"      "malaria"
```

```
c(1, 2, 6, 87)
```

```
## [1]  1  2  6 87
```

Vectors

The c() stands for “concatenate”

```
c("HIV", "TB", "malaria")
```

```
## [1] "HIV"     "TB"      "malaria"
```

```
c(1, 2, 6, 87)
```

```
## [1]  1  2  6 87
```

Vectors

```
c("HIV", "TB", "malaria")
```

Vectors can contain strings

```
## [1] "HIV"     "TB"      "malaria"
```

```
c(1, 2, 6, 87)
```

Or numbers

```
## [1]  1  2  6 87
```

Vectors

```
c("HIV", "TB", "malaria")
```

Vectors can contain strings

```
## [1] "HIV"     "TB"      "malaria"
```

```
c(1, 2, 6, 87)
```

Or numbers

```
## [1]  1  2  6 87
```

```
c("CDC", "FDA", 897)
```

... but not both

What happened here?

```
## [1] "CDC" "FDA" "897"
```

Now you try!

- Make two vectors in R and assign them to objects.
  - Numeric
  - String

Vectorized calculations

```
c(1, 2, 3, 4) + 1
```

```
## [1] 2 3 4 5
```

```
c(1, 2, 3, 4) * 2
```

```
## [1] 2 4 6 8
```

```
c(1, 2, 3, 4) + c(5, 6, 7, 8)
```

```
## [1]  6  8 10 12
```

Functions

- Functions are instructions to perform a task
  - They are *algorithms*, or consistent set of rules
- R has built-in functions for many basic things
- Functions generally look like this: *function(object)*
- We can also “add on” extra functions by loading new libraries (we’ll get to this later), or we can write our own functions to do whatever we want

Functions

- Most functions in R are vectorized
  - This means they act on all items in a vector
- Why does this matter?
  - If you misunderstand it, your math will be wrong
  - It's useful for basic calculations and analysis:
    - divide all numbers by 100 to calculate a %
    - multiply per-capita rates by total population

Functions

```
mean(c(1, 2, 3, 4, 5))
```

```
## [1] 3
```

```
sd(c(1, 2, 3, 4, 5))
```

```
## [1] 1.581139
```

```
summary(c(1, 2, 3, 4, 5))
```

```
##    Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##       1       2       3       3       4       5
```

Functions

```
mean(c(1, 2, 3, 4, 5))
```

```
## [1] 3
```

```
sd(c(1, 2, 3, 4, 5))
```

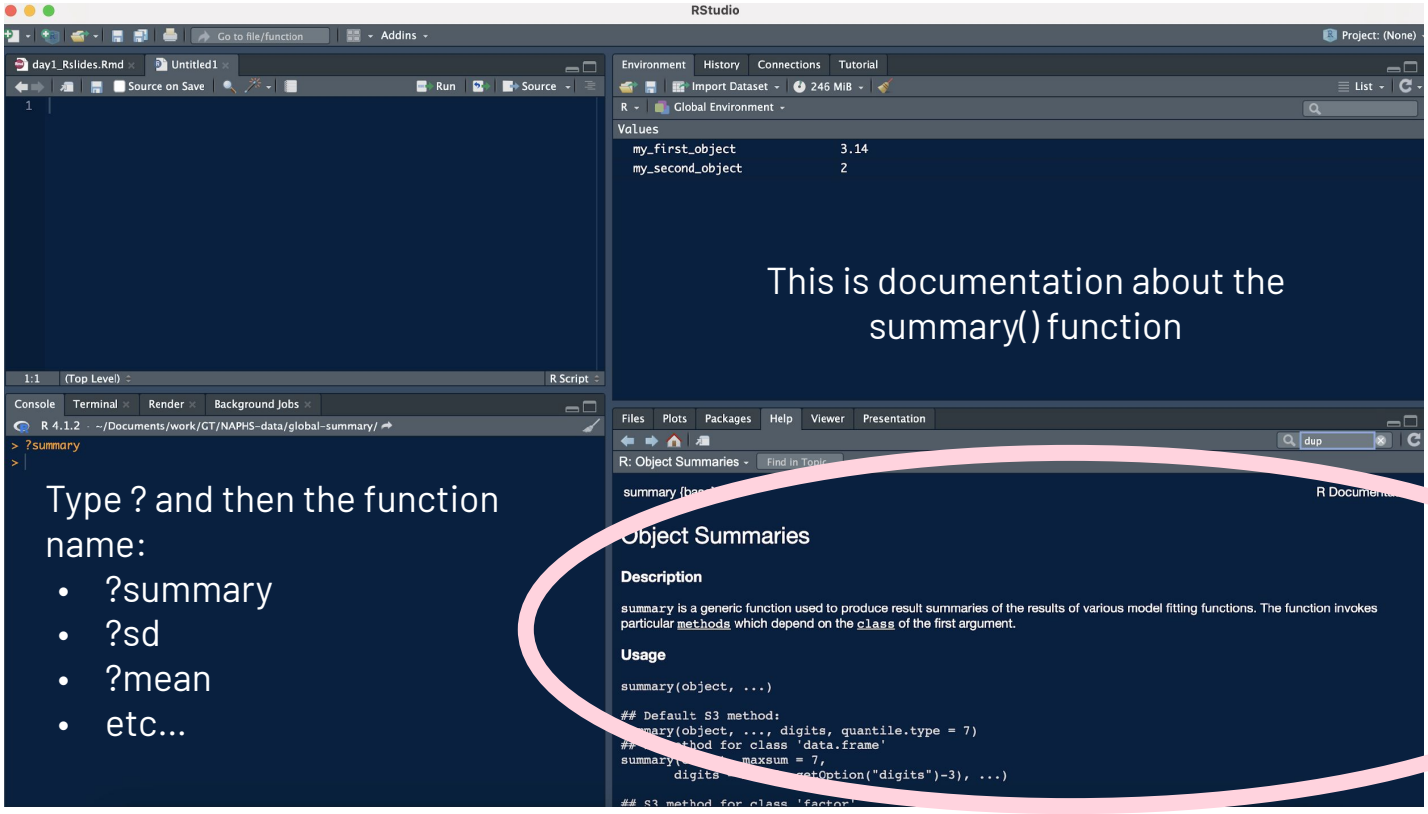
```
## [1] 1.581139
```

```
summary(c(1, 2, 3, 4, 5))
```

```
##    Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##       1       2       3       3       4       5
```

Learn more about functions

?function or help(function)



Now you try!

- Take the average of three or more numbers
- Use “?” to learn more about the function sd()

Goals for today

- Understand what statistical programming is
- Get acquainted with Rstudio
- Write your very first R code (at least, of this workshop)
  - vectors
  - functions
  - accessing documentation
- Explore github to access course materials

What is github?

What is github?

- Have you ever saved a bunch of versions of a paper on your computer with different file names at different dates or times of day?
- Backups are useful to save progress, understand what we've done before, and look into problems/bugs
- Github is a tool do help do this with code

What is github?

We'll talk more about github later in this workshop. For now, I'd like you to be able to use it to access course materials any time you'd like to.

Data Science Basics in R Workshop

This workshop will build literacy and basic proficiency in statistical programming, with a focus on the skills needed to conduct data analyses in professional healthcare and public health workspaces. We will cover the basics of data management, data cleaning, data visualization, and basic statistical calculations in R, and version control in github. Participants will leave with a small portfolio of relevant data visualizations and analyses completed using a real-world public health dataset.

This workshop is part of the 2024 Georgetown University Health Diplomacy Training Initiative led by the Center for Health Science and Security.

No prior programming experience is necessary for this course, though to follow along with course materials, participants will require access to a fully charged laptop or computer. There are no required course materials or textbooks, though we will work together through select materials from the online Intro to R book developed by Alex Douglas, Deon Roos, Francesca Mancini, Ana Couto and David Lusseau.

If you have questions, feel free to reach out at sde31@georgetown.edu.

Now you try!

Open the course github and click around for a few minutes

https://github.com/seaneff/data-science-basics-2024

Recap for today

What we talked about

- Understand what statistical programming is
- Get acquainted with Rstudio
- Write your very first R code (at least, of this workshop)
  - vectors
  - functions
  - accessing documentation
- Explore github to access course materials

OPTIONAL homework

choose your own dataset

- Tomorrow, we will begin using worked examples with **real data**
- The materials I have prepared focus on measles and vaccine policy
- If you have other datasets you know you want to explore, let me know!
  - We'll still focus primarily on the measles dataset as a class
  - There is also room to explore other areas! Last year students explored sanctions, extinction-risk, and public safety datasets
- Please email me before tomorrow's class if there is a dataset you are interested in (limit 1 per person), and I will do my best to work it in! **sde31@georgetown.edu**

OPTIONAL homework

choose your own dataset: options to explore

- TidyTuesday: https://github.com/rfordatascience/tidytuesday
- Security Studies: https://guides.library.georgetown.edu/Security/data
- Spotify: www.kaggle.com/datasets/iamsumat/spotify-top-2000s-mega-dataset

The world is your oyster. Datasets don't need to be related to your major, they can also be other things you find interesting or fun!

Plan for tomorrow

Data management and version control

- Understand the foundations of data management
- Identify some useful global health and health diplomacy datasets
- Load and clean your first dataset in R
    - explore a new dataset while learning about data structures
- Learn best practices for documentation
- Get familiar with Github (by writing poems about unicorns)

Thank you!

See you tomorrow.

Please come with a fully charged laptop.
